

Creating a deep learning based Flood Inundation Model to predict the flood vulnerability for the NorthEastern Region of India.

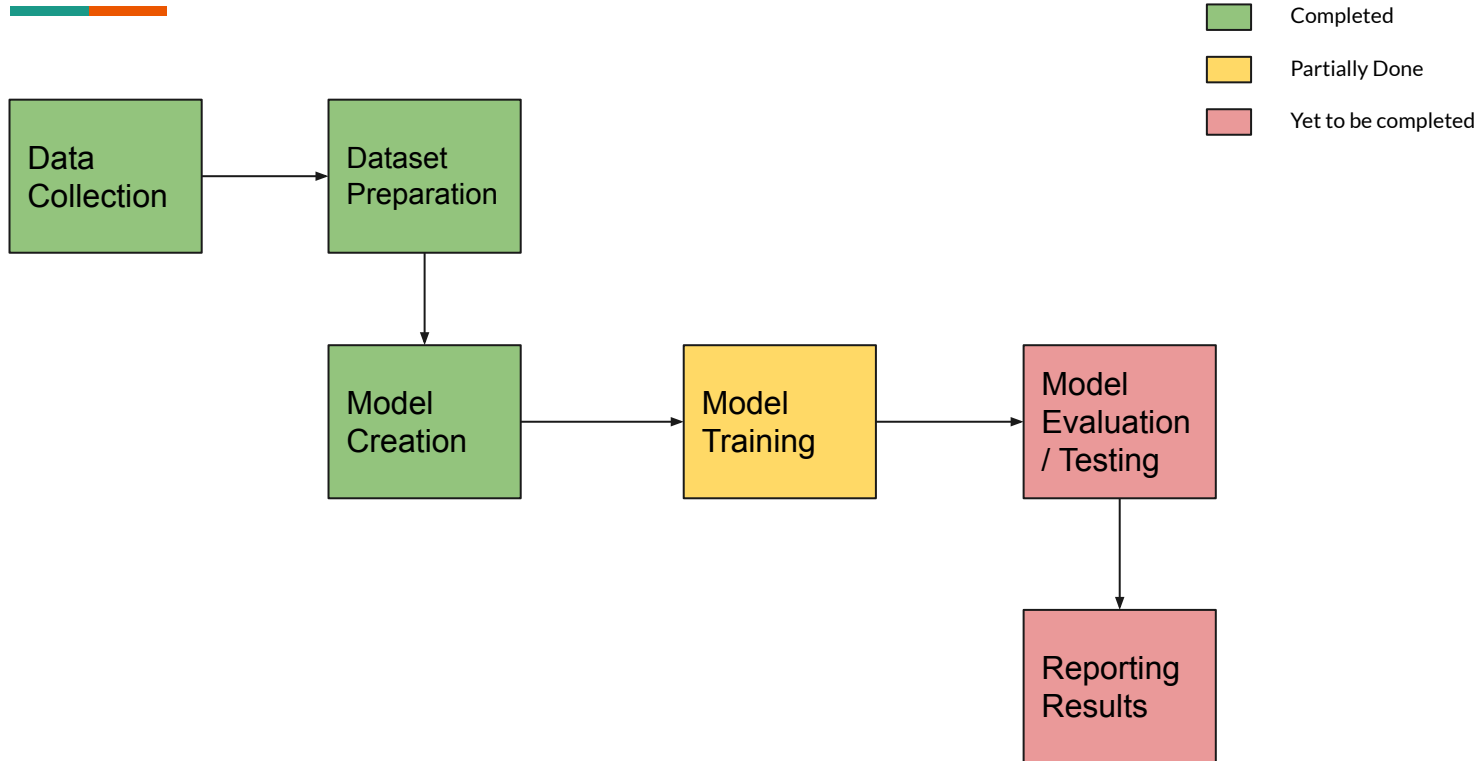

- Manpa Barman, Pritom Gogoi, Dr. Santonu Goswami

Objective

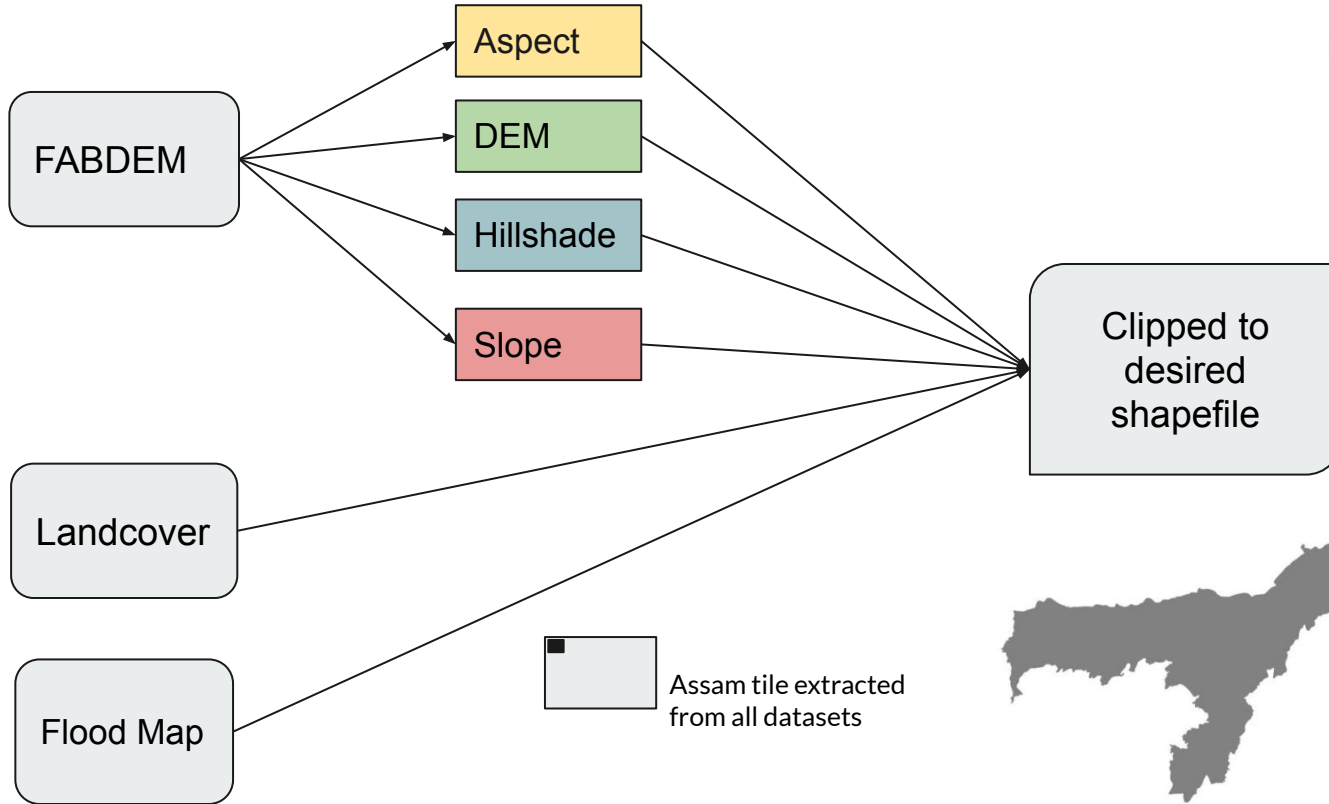

1. Creating a model which can predict the flood vulnerability of a region based of various spatial inputs.
2. Unlike the hydrodynamic models, our deep learning based approach attempts to reduce the inference time of flood prediction for a particular area.

Workflow of the project

Data Collection

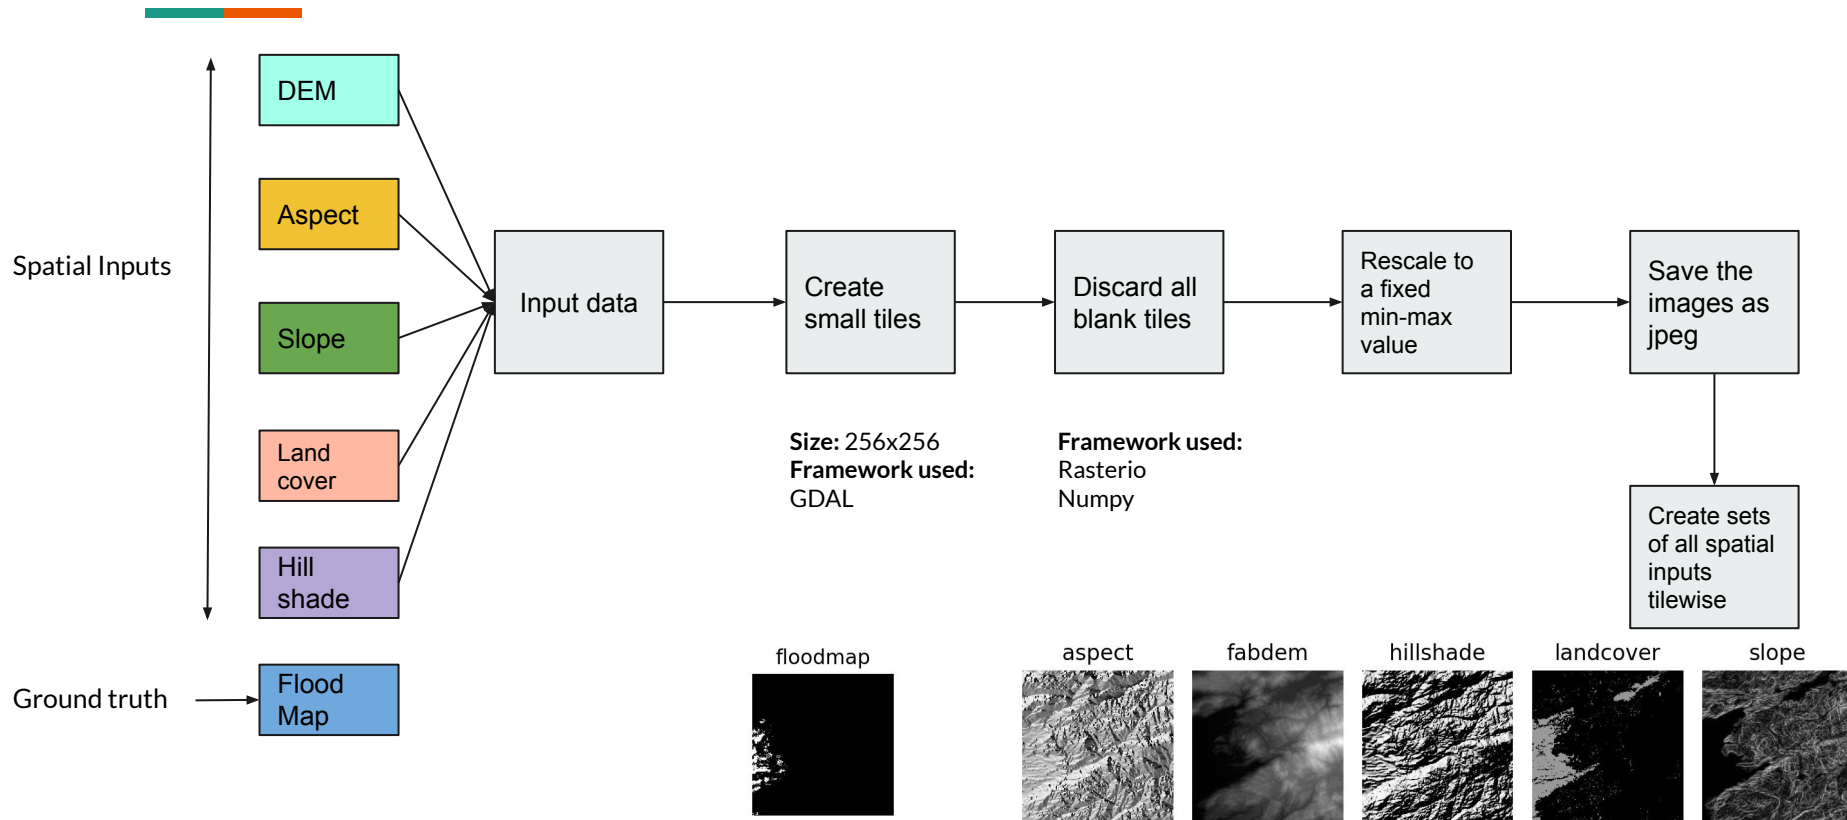

Technologies used:

- Earth Engine api
- GDAL

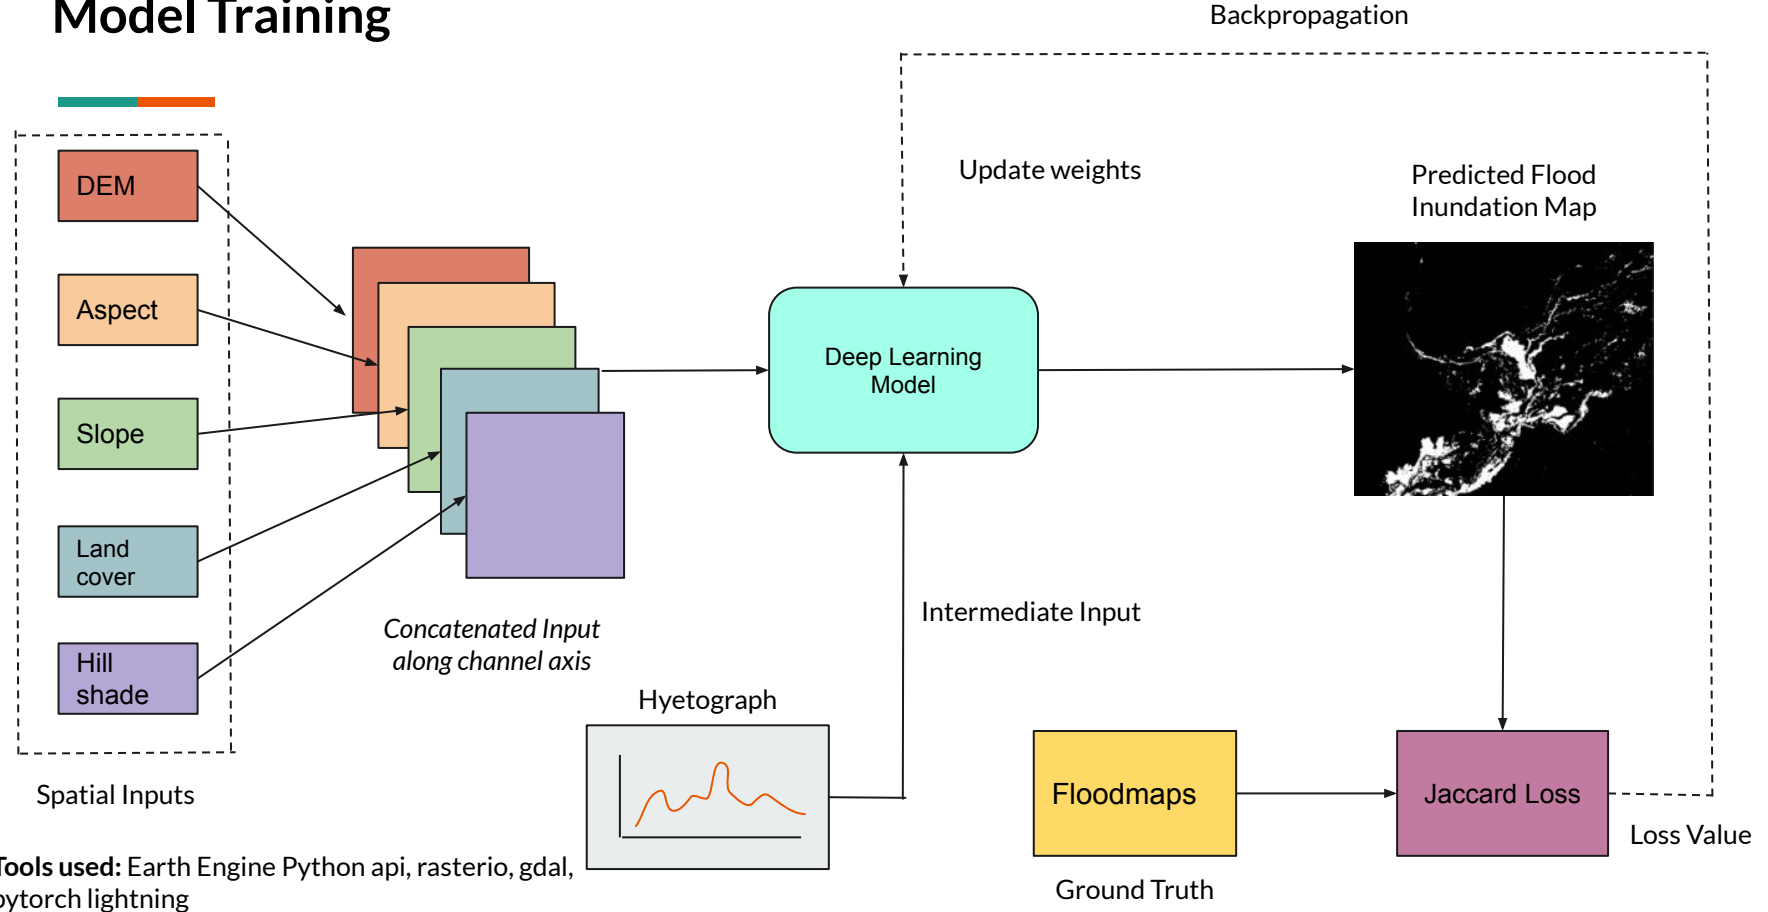

Datasets used :

- FABDEM (India and Assam coordinates data)
- Sentinel-1 SAR data
- ESA Worldcover 10m v100

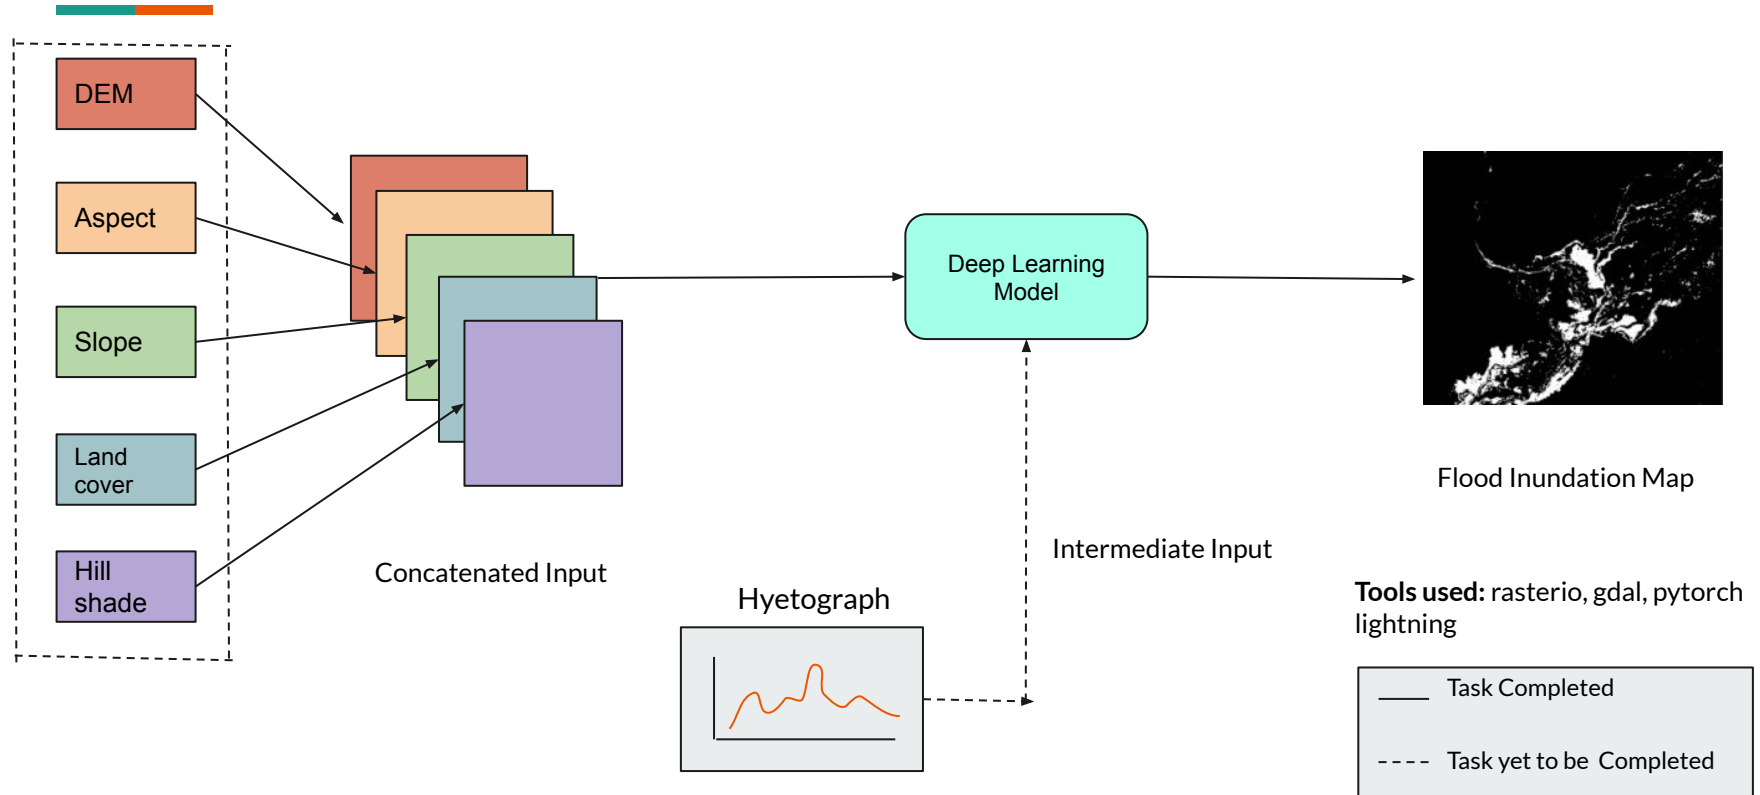

Data Preparation

Model Training

Model Evaluation

Thank you for your attention.
